

## Omnivex

With a new version for its digital signage software for screenmedia expo europe this year, Omnivex's Moxie digital signage software package covers the whole gamut of tasks from content creation and management to the incorporation of external data feeds, to monitoring and controlling play-out devices. And it can now be used to manage video walls too. With synchronisation capabilities that the company says will carry on working even if one or more of the player PCs in a system needs to reboot.

Other new features in Moxie include the creation of multiple tasks for quicker synchronisation of content files, playlists and schedules, and a data proxy feature that enables multiple players to connect through a single node, significantly reducing network traffic.
